└─Why do we integrate things? Logarithms

WHY DO WE INTEGRATE THINGS? LOGARITHMS

Take $\frac{dt}{t}$, as a differential on the group \mathbb{R}^n , this is translation invariant, i.e. $(\alpha - y)^n(kx/s) = d(\alpha x)/\alpha x - dx/x$, hence $\int_0^1 \frac{dx}{x} = \log|t| \cdot \mathbb{R}^n \to \frac{dx}{t}$ has the property that $\int_0^{\infty} \frac{dx}{t} = \int_0^{\infty} \frac{dx}{t} = \int_0^x \frac{dx}{t} = \int_0^x \frac{dx}{t} + \int_0^x \frac{dx}{t} = \int_0^x \frac{dx}{t} =$

Integration can define logarithm maps between groups and their tangent spaces. How do we calculate $\log |t|$? Power series on $R_{>0}$ and use the

How do we calculate $\log |t|$? Power series on $\kappa_{>0}$ and use relation $\log |t| = \frac{1}{2} \log t^2$

there are many answers to this question

As number theorists it is natural to ask,

└─Coleman integration

COLEMAN INTEGRATION

Is there p-adic analogue of this? Given a p-adic space, (as p-adic solutions to some equations) we can locally write down convergent power series for a 1-form and integrate.

As number theorists it is natural to ask,

└─Coleman integration

└─Coleman integration

As number theorists it is natural to ask,

COLEMAN INTEGRATION

Is there p-adic analogue of this? Given a p-adic space, (as p-adic solutions to some equations) we can locally write down convergent power series for a 1-form and integrate.

For instance near a point α : $d(\alpha + x) \qquad dx \qquad 1 \longrightarrow (-x)^n$

 $= \frac{u(\alpha + x)}{\alpha + x} = \frac{ux}{\alpha + x} = \frac{1}{\alpha} \sum_{i=1}^{n} \left(\frac{-x}{\alpha} \right) dx$

└─Coleman integration

As number theorists it is natural to ask,

COLEMAN INTEGRATION

Is there p-adic analogue of this? Given a p-adic space, (as p-adic solutions to some equations) we can locally write down convergent power series for a 1-form and integrate. For instance near a point α :

$$=\frac{1}{\alpha+x}=\frac{1}{\alpha+x}=\frac{1}{\alpha}\sum_{x}\left(\frac{1}{\alpha}\right)dx$$

$$\int_{n+x} \omega = -\sum \frac{1}{n+1} \left(\frac{-x}{\alpha} \right)^{n+1} + C$$

└─Coleman integration

As number theorists it is natural to ask,

COLEMAN INTEGRATION

Is there p-adic analogue of this? Given a p-adic space, (as p-adic solutions to some equations) we can locally write down convergent power series for a 1-form and integrate.

For instance near a point α :

 $= \frac{\mathrm{d}x}{\alpha + x} = \frac{1}{\alpha} \sum \left(\frac{-x}{\alpha}\right)^n \mathrm{d}x$

 $\omega = -\sum \frac{1}{n+1} \left(\frac{-x}{\alpha}\right)^{n+1} + 1$

But we cannot find C! There is a different choice in each disk.

—Applications: Chabauty-Kim

many authors have tried to make this explicit and useful in examples culminating in

APPLICATIONS: CHABAUTY-KIM

Minhyong Kim has vastly generalised the above to cases where rank(Jac(X))(Q) ≥ genus(X)

This can be made effective, and computable

Theorem (Balakrishnan-Dogra-Muller-Tuitman-Vonk) The (cursed) modular curve $X_{\rm spin}(13)$ (of genus 3 and jacobian rank 3), hos 7 rotional points: one cusp and 6 points that correspond to CM elliptic curves whose mod-13 Galais representations land in normalizers of split Cartan subgroups.

APPLICATIONS: CHABAUTY-KIM

Minhyong Kim has vastly generalised the above to cases where

 $rank(Jac(X))(Q) \ge genus(X)$

This can be made effective, and computable

Theorem (Balakrishnan-Dogra-Muller-Tuitman-Yonk). The (cursed) modulor curve X_{spin}(13) (of genus 3 and jocobian rank 3), has 7 rational points: one cusp and 6 points that correspond to CM elliptic curves whose mod-13 Galois representations land in normalizers of split Cartan subgroups.

Their method can also be applied to other interesting curves: Theorem (WIP B.-Bianchi-Triantafillou-Yonk)

Theorem (WIP B.-Bianchi-Triantafillou-Yonk). The modular curve X₀(67)* (of genus 2 and jacobian rank 2), has rational points contained in an explicitly computable finite set of 7-adic points.
